

AeroOps vs. the Incumbents — Feature Comparison

For: flight schools, flying clubs, universities, FBOs, maintenance shops, and corporate flight departments evaluating an operations platform. **As of:** 2026 · **Prepared by:** AeroOps

How to read this sheet

- Every cell is **AeroOps's positioning based on publicly available information**, not a certified audit of a competitor's product.
- Competitor cells should be verified directly with that vendor** before you make a decision. Product capabilities change; ours and theirs.
- Unknown = we could not independently confirm it** from public information. We would rather write "Unknown" than claim something about a competitor we can't stand behind in front of you.
- For **AeroOps**, a check mark (✓) means the capability is **shipped and running today**. **"Roadmap"** means it is planned and has a defined seam in the product, but is **not live yet**. We hold ourselves to the same honesty we ask of the competitors.

Legend: ✓ = present · **partial** = present but limited or add-on · **X** = not offered · **Unknown** = not independently verified · **Roadmap** = planned, not yet shipped (AeroOps only)

The comparison

Capability		Flight Schedule Pro	Flight Circle	Talon Systems (Talon.aero)	FlightLogger
Scheduling — aircraft/instructor/room booking, conflict detection	✓	✓	✓	✓	✓
Dispatch — release checklist + Hobbs/Tach closeout	✓	partial	Unknown	Unknown	Unknown
Maintenance — squawks, work orders, return-to-service	✓	partial	partial	Unknown	Unknown
Billing — auto-invoice generated <i>from</i> the dispatch closeout	✓	Unknown	partial	Unknown	Unknown
Training records / checkride readiness — stages, endorsements, hours	✓	partial	partial	✓	✓
Cloud / true SaaS	✓	✓	✓	✓	✓
Modern UI — fast, dark-mode-native, enterprise-calm	✓	Unknown	Unknown	Unknown	Unknown
Mobile / PWA — installable, responsive, bottom-nav	✓ (installable PWA)	✓ (mobile app)	✓ (mobile app)	Unknown	Unknown
Automation / domain events — events fire on release, closeout, ground	✓	Unknown	Unknown	Unknown	Unknown
Role-based dashboards — the screen changes per seat, gated by permission	✓	Unknown	Unknown	Unknown	Unknown
Reporting / executive view — utilization, revenue, AR aging	✓	partial	partial	✓	partial

Capability		Flight Schedule Pro	Flight Circle	Talon Systems (Talon.aero)	FlightLogger
Import from a competitor — mapped, tested, rollback-able	✓ (Import Center)	Unknown	Unknown	Unknown	Unknown
Immutable audit trail — every mutation logged, first-class surface	✓	Unknown	Unknown	Unknown	Unknown
Multi-tenant security — org scope from session, tenant isolation	✓	Unknown	Unknown	Unknown	Unknown
Public API + signed webhooks	✓	Unknown	Unknown	Unknown	Unknown

Where AeroOps is honestly *not* finished yet

A six-figure buyer will test claims, so here is the roadmap line — stated before you ask:

Capability	Status today	Notes
Customer card payments on invoices	Roadmap	Invoices, ledgers, payments, and AR aging are live in-app; the Stripe Connect processor seam is built but not attached . You can invoice and record payments today; taking a card online is on the roadmap.
Live METAR / TAF weather	Roadmap	Weather is wired to a single source keyed to your active location and is simulated today (deterministic generator). The live Aviation Weather adapter swaps in behind the same interface — no screen changes.
Email (verification, resets, invites, digests)	Roadmap	The transactional-email provider is not yet attached; invite links are shown once in-app today.
Document file uploads (object storage)	Roadmap	The document vault is metadata-only today ; signed-URL file storage (S3/R2) is on the roadmap.
Cross-location / cohort-term reporting roll-ups	Roadmap	Single-location reporting and the executive view ship today; multi-base roll-up and cohort/term grouping are roadmap 1.5.

Everything else in the main table marked ✓ for AeroOps is **shipped and demonstrable in a live session** on the demo org (Golden Gate Aviation Academy).

The one row that decides it

Most tools in this category do scheduling, and several do it well. The difference that matters operationally is the **dispatch → closeout → invoice "one motion."**

In AeroOps, when a flight closes out, a **single database transaction** does all of this atomically:

1. Flips the dispatch RELEASED → CLOSED (guarded so a double-submit can't bill twice). 2. Computes billable time from the Hobbs delta. 3. Rolls the aircraft meters forward — Hobbs, Tach, engine time (SMOH), prop time. 4. Logs the pilot/student time (dual received/given or PIC, solo hours). 5. Generates the invoice with line items (aircraft wet rate + instructor time). 6. Decrements the student's account balance. 7. Optionally captures a squawk (GROUNDING / MAJOR / MINOR) that flows straight to Maintenance.

Either **all of it happens or none of it does**. That is why revenue leakage — the flight that flew but never got billed — is *structurally* impossible in AeroOps, not merely discouraged by a checklist. For every competitor cell touching this workflow we wrote **Unknown or partial**, because we cannot verify from public information that any of them binds meters, ledgers, and invoices into a single atomic transaction. Ask them to show you.

What this sheet deliberately does not claim

pedigree.

- We do **not** compete on flight planning / EFB (that's ForeFlight's territory — we integrate), airline/Part 121 ops, avionics hardware, or being your general ledger.
- We compete on being **one connected operating system** — where the schedule knows the airplane is grounded, the invoice knows the flight closed, and every answer the system gives carries its reasons — with an **import path out of whatever you use now, including a rollback if the test import scares you.**
